RORDER

Autonomous Swarm of Heterogeneous Robots for Border Surveillance

> This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 740593

- Border authorities face important challenges in patrolling and protecting the borders.
- Low levels of situational awareness
- Numerous and diverse aspects should be considered
 - Heterogeneity of threats
 - Wideness of the suveyed area
 - Adverse weather conditions
 - Wide range of terrains
 - Comlex operational environments

- The overall framework for the Roborder project includes multiple domains
 - Border surveillance
 - Marine pollution detection
 - Situational awareness
- Vision
 - Develop and demonstrate a fully-functional autonomous border surveillance system
 - Unmanned mobile robots equipped with multimodal sensors
 - Enhanced detection capabilities for early identification of criminal activities and marine pollution events

Objectives

- Main objectives
 - Autonomous border surveillance system with unmanned mobile robots
 - Incorporate multimodal sensors as part of an interoperable network
 - Wide range of operational and environmental settings
 - Enhanced static networked sensors
 - Complete and situational awareness picture
 - Early identification of criminal activities and hazardous incidents
- Innovation objectives
 - Adaptable sensing, robotics, and communication technologies
 - Tele-operation of autonomous agents through a 3D user interface and decision support

ROBORDER Architecture

Use case scenarios

- Early identification and tracking of illegal activities
 - Detecting unauthorized sea border crossing
 - Detecting unauthorized land border crossing and signals trespassers
 - Detecting unauthorized land border crossing
 - Tracking high-tech smugglers
 - Detecting the terrorist attack coming through cross border
 - Early and effective identification of passive boats moving offshore
 - Tracking organized crime activity in remote border areas
- Early identification and tracking of illegal communications
 - Detecting jamming attacks
- Detection of pollution and other accidents occurred in the borders
 - Detecting pollution accidents

Demonstrators

- Unauthorized sea border crossing
 - Monitoring sea passages and islets
 - Plethora of sensors: Coastal radars, optical cameras etc.
 - Interaction of mobile devices with static infrastructure
- Unauthorized land border crossing
 - Patrol hardly accessible territories
 - Tracking illegal activities to mitigate personal risks
- Detecting pollution accidents
 - Tracking pollutants spilled at sea
 - Determining key environmental conditions

Impact

- Expected impact
 - Enhance the protection of human lives exposed at land and sea
 - Improve identification and tracking illegal activities
 - Influence positively anti-drug and anti-smuggling operations
 - Perform improved search and rescue operations
 - Improve environmental protection for governmental agencies
- Expected results
 - Provide an overall border security solution
 - Effective operation of heterogenous multi-asset system
 - Photonic radar network and UAV onboard passive radar
 - Threat recognition and identification of cyber physical attacks

IO1 Adaptable sensing, robotics and communication technologies for different operational and environmental needs						IO2 Detection and identification of border-related threats					IO3 Tele-operation of autonomous agents through a 3D user interface and decision support

ROBBORDER

Operational timeline

Overall structure

- Package list
 - WP1: User requirements and pilot use cases
 - WP2: Sensing, robotics and communication technologies
 - WP3: Detection and identification of border-related threats
 - WP4: Command and control unit functionalities
 - WP5: Integration of Roborder platform for the remote assessment of border threats
 - WP6: Demonstrations and evaluation
 - WP7: Dissemination and exploitation
 - **WP8**: Project management
- Milestone List
 - **MS1**: Project setup and platform development roadmap
 - MS2: Operational prototype
 - **MS3**: 1st prototype
 - MS4: 2nd prototype
 - MS5: Final system

Work packages interplay

Evaluation & Outcomes

- Prototype and final system
 - User-oriented evaluation (end-users group etc.)
 - System-centric evaluation (metrics, indicators etc.)
- Outcomes
 - Final system dealing with 3 use cases
 - Fully operational and autonomous border surveillance system
 - Enhanced detection and classification capabilities
 - CISE-compliant representation model and sematic reasoning
 - Decision support and situational awareness

Exploitation and Dissemination

- Exploitation of results
 - Development of proper modules and tools
 - Modules to be exploited by the technical partners
 - Business plan to exploit the final system
- Dissemination of results
 - Publications in scientific conferences and journals
 - Visits of website an social media (<u>http://roborder.eu/</u>)
 - Downloads of publicly available online material
 - Participation/attendance in workshops
 - Demonstration of results in end-users group
